

LSC TRM Panel before product application

LSC TRM Panel 10 days after product was sprayed

## Success Story

# LSC's Vegetative Rehabilitation System chosen for high-profile installation.

**In June 2012, a combination of severe flooding, steep slopes, and severely nutrient-deficient soils closed and delayed the reopening of a two-mile stretch of scenic Highway 210 in Jay Cooke State Park, Minnesota.** As a result, the prime contractor sought innovative methods—beyond just topsoil—of re-establishing vegetation there.

A design/build team, led by senior management in VEIT's Duluth office and assisted by engineering and environmental consultants from BARR and SRF, put out a Call for Innovation to manufacturers interested in displaying their solutions onsite.

In response, 13 test panels—including a compost panel—were installed. Working with state and local experts and consultants LSC's engineers and scientists provided a TRM hydraulic infill solution, utilizing industry's best management practices, including our BSA technology Organix™.

**After multi-party deliberations and a third-party evaluation, the design/build team chose LSC's Vegetative Rehabilitation System as** 1) the best onsite results; 2) the most cost-effective solution; and 3) the easiest installation system. (It's the industry's only one step solution.)

**In the year since the original panels were installed by LSC,** the predominantly native seed blend's density and performance have met ongoing site expectations with excellent diversity. The site has endured a Minnesota winter, and vegetation growth has been established through a TRM system.

**Let our network of agronomists, lab scientists, and seed experts evaluate your site. Our engineers will build a site-specific, one-step solution to close your permits.**

Please contact one of our Representatives or Application Engineers today to learn how easily you can implement LSC's Vegetative Rehabilitation System.
